

Online Cash Payments

An Alternative to Payment Processors

General Knowledge to Know Beforehand

- Tell customers to wrap money in paper in envelope
- Follow all laws and pay all required taxes
- Divide responsibilities at your place of business
- This can work with checks too

1. Cash Payment with Accounts

For every account, give an 9-digit alpha-numeric code (X-XXXX-XXXX). There are 101 trillion unique codes that can be made with that combination.

When the consumer pays, he puts his unique code in the envelope. A PO Box is highly recommended for the receiver.

2. Cash Payment for an Online Store

List every product with a unique code, then add accessories at the end.

Example: 1776-1-5

- Product 1776
- Accessory 1 (Yes)
- Color 5 (Purple)

3. Bitcoin with wallet addresses

Similar to #1 and 2, the customer Direct Messages (DM)/mails the seller with their wallet address and which product they want to buy. The receiver then waits for the payment from the specific address, then sends out the product. Since this is a digital system (if you use DMs), this system can be automated.

NOTE: Since this is digital, you can use an entry system directly on your website

NOTE: Use a stablecoin. Most other cryptocurrencies are too unstable.

4. Cash-on-delivery

Have the customer pay on delivery

5. Use money orders

6. Direct Bank Transfers
